PART OF SOUTHERN CALIFORNIA SHOWING AREA DESCRIBED IN THIS AND PREVIOUS BULLETINS OF THE NO. 91 SERIES

ABSTRACT

This bulletin is one of a series on water wells and springs in southern California desert areas. The series is prepared by the U.S. Geological Survey and published by the California Department of Water Resources.

Each bulletin shows location of water wells and springs in a part of the southern California desert regions; describes well depth and yield, water use and level on dates observed; names the well owner; provides pumping data, including depths, rates, static water levels, drawdowns, and specific capacities; and lithologic data from drillers' well logs.

Earlier bulletins in the series are:

Bulletin No. 91-1: Data on Wells in the West Part of the Middle Mojave Valley Area, San Bernardino County, California. June 1960; 126 p. [Out of print]

91-2: Data on Water Wells and Springs in the Yucca Valley-Twentynine Palms Area, San Bernardino and Riverside Counties, California. June 1960; 164 p. [Out of print]

91-3: Data on Water Wells in the Eastern Part of the Middle Mojave Valley Area, San Bernardino County, California. August 1960; 223 p. [Out of print]

91-4: Data on Water Wells in the Willow Springs, Gloster, and Chaffee Areas, Kern County, California. September 1960; 90 p. [$1.50 a copy]

91-5: Data on Water Wells in the Dale Valley Area, San Bernardino and Riverside Counties, California. March 1961; 60 p. [$1.50 a copy]

91-6: Data on Wells in the Edwards Air Force Base Area, California. June 1962; 212 p. [$3.00 a copy]

91-7: Data on Water Wells and Springs in the Chuckwalla Valley Area, Riverside County, California. May 1963; 78 p. [Out of print]

91-8: Data on Water Wells and Springs in the Rice and Vidal Valley Areas, Riverside and San Bernardino Counties, California. May 1963; 36 p. [Out of print]

91-9: Data on Water Wells in Indian Wells Valley Area, Inyo, Kern, and San Bernardino Counties, California. May 1963; 246 p. [Out of print]

91-10: Data on Wells and Springs in the Lower Mojave Valley Area, San Bernardino County, California. December 1963; 212 p. [Out of print]

91-11: Data on Water Wells in the Western Part of the Antelope Valley Area, Los Angeles and Kern Counties, California. May 1965; 278 p. [$1.50 a copy]

91-12: Data on Water Wells in the Eastern Part of the Antelope Valley Area, Los Angeles County, California. December 1966; 448 p. [$4.75 a copy]

91-13: Water Wells and Springs in Soda, Silver, and Cronise Valleys, San Bernardino County, California. August 1967; 80 p. [$1.00 a copy]

91-14: Water Wells and Springs in Bristol, Broadwell, Cadiz, Danby, and Lavic Valleys and Vicinity, San Bernardino and Riverside Counties, California. August 1967; 80 p. [$1.50 a copy]

91-15: Water Wells and Springs in Borrego, Carrizo, and San Felipe Valley Areas, San Diego and Imperial Counties, California. January 1968; 142 p. [$2.00 a copy]

91-16: Water Wells and Springs in the Fremont Valley Area, Kern County, California. February 1969; 158 p. [$2.00 a copy]

91-17: Water Wells and Springs in the Panamint, Searles, and Knob Valleys, San Bernardino and Inyo Counties, California. December 1969; 110 p. [$2.00 a copy]

91-18: Water Wells in the San Luis Rey River Valley Area, San Diego County, California. May 1971; 347 p. [$4.00 a copy]

91-19: Water Wells in the Harper, Superior, and Cuddeback Areas, San Bernardino County, California. May 1971; 99 p. [$2.00 a copy]

91-20: Water Wells and Springs in the Western Part of the Upper Santa Margarita River Watershed, Riverside and San Diego Counties, California. August 1971; 377 p. [$4.00 a copy]

91-21: Water Wells and Springs in Ivanpah Valley, San Bernardino County, California. January 1972; 56 p. [$2.00 a copy]

91-22: Water Wells and Springs in the Eastern Part of the Upper Santa Margarita Watershed, Riverside and San Diego Counties, California. August 1974; 213 p. [$3.00 a copy]

Previous Investigations and Acknowledgments

The data on ground-water hydrology and geology presented in this report came from several published reports; from numerous files in Federal, State, and local governmental agencies; from the files of private individuals; and from field canvass of individual wells by J. D. Horne, R. L. Blazs, and L. A. Price of the U.S. Geological Survey.

The published reports include Mendenhall (1909); Waring (1915); Brown (1920 and 1923); Kocher and Youngs (1926); Ver Planck (1952); California Division of Water Resources (1954); Metzger (1965); Metzger, Loeltz, and Irelan (1973); and the U.S. Environmental Protection Agency (1972). The previously unpublished data included in this report are from the files of the California Division of Water Resources, Palo Verde Irrigation District, U.S. Department of Agriculture, Riverside County Flood Control District, and many individuals and well owners.

The geologic map in this report was compiled from the original unpublished sources used by the California Division of Mines and Geology for the published Salton Sea map sheet (scale 1:250,000) by Jennings (1967). The original unpublished sources were used because they were closer to the scale used in this report (1:62,500). Original geologic mapping was by James Gamble and E. A. Donehy, geologists with the Southern Pacific Land Co.; C. W. Jennings and R. B. Saul, geologists with the California Division of Mines and Geology; and Warren Hamilton, geologist with the U.S. Geological Survey. Some modifications or additions were made by W. R. Moyle, Jr., in this report.

The cooperation and assistance of all those who contributed materially to the completeness of the data in this report are gratefully acknowledged.

Purpose and Scope of the Investigation

The data in this bulletin were collected by the U.S. Geological Survey, in cooperation with the California Department of Water Resources, as a phase of the investigation of water wells and springs and of general hydrologic conditions throughout much of the desert region of southern California.

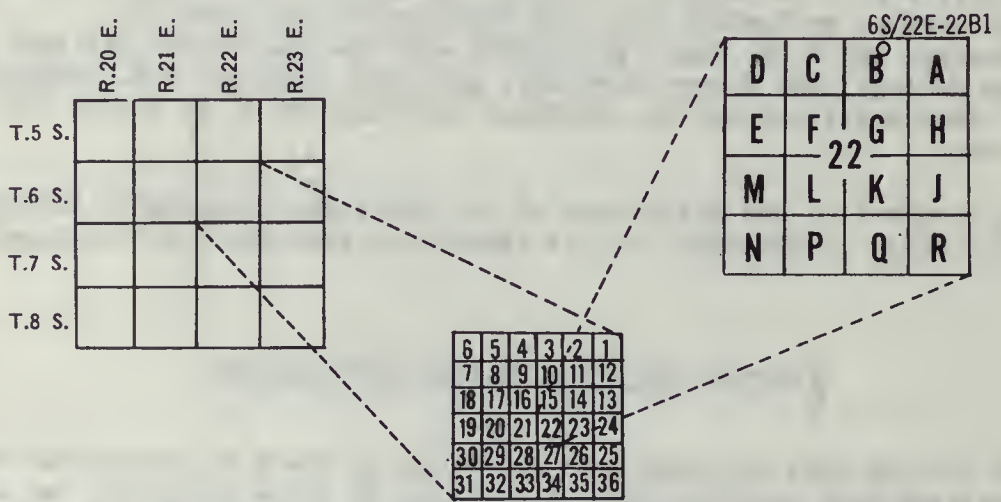

The objective of the investigation was to collect and tabulate ground-water data for the individual desert basins, in order to provide other agencies and the general public with the information needed to make ground-water evaluations and to plan water utilization and developmental work.

The work included (1) brief reconnaissance of major geologic features to determine the extent and general character of the deposits that contain ground water; (2) field examination of most water wells and one spring in the area to determine their location with respect to the geographic and cultural features and the public-land net and to record well depth and casing diameter, type and

capacity of pumping equipment, use of the water, and other pertinent information available at the well site; (3) measurement of the depth to water below land surface; (4) selection of representative wells to be measured periodically to detect and record changes of water level; and (5) collection and tabulation of well and spring records, including water-level measurements, chemical analyses, and pumping-test data.

Well- and Spring-Numbering System

Wells and springs are numbered according to their location in the rectangular system for the subdivision of public land. For example, in the number 6S/22E-22B1, the part of the number preceding the slash indicates the township (T. 6 S.), the part between the slash and the hyphen indicates the range (R. 22 E.), the number between the hyphen and the letter indicates the section (sec. 22), and the letter indicates the 40-acre subdivision of the section. Within the 40-acre tract, wells are numbered serially, as indicated by the final digit. Thus, well 6S/22E-22B1 is the first well to be listed in the NW¼NE¼ sec. 22, T. 6 S., R. 22 E., as shown in the diagram below. All well and spring locations are referenced to the San Bernardino base line and meridian.

Where a Z has been substituted for the letter designating the 40-acre tract, the Z indicates that the well is plotted from an unverified location description; the indicated sites of such wells were visited, but no evidence of a well could be found.

Springs are numbered the same way except that an S is placed between the 40-acre subdivision letter and the final digit as shown in the following spring number: 9S/20E-10DS1.

CONVERSION FACTORS

For readers who prefer metric units rather than English units, conversion factors for the terms used herein are listed below:

Multiply English unit	*By*	*To obtain metric unit*
acres	4.047×10^{-3}	square kilometers
ft (feet)	3.048×10^{-1}	meters
gal/min (gallons per minute)	6.309×10^{-2}	liters per second
(gal/min)/ft (gallons per minute per foot)	2.070×10^{-1}	liters per second per meter
in (inches)	2.540×10	millimeters
mi (miles)	1.609	kilometers
mi^2 (square miles)	2.590	square kilometers

GENERAL FEATURES

Palo Verde Valley covers an area of about 575 mi^2 on the west side of the Colorado River in California. The valley contains the towns of Blythe, Palo Verde, and Ripley. The north edge of the study area is along the surface-water drainage divide of the Big and Little Maria Mountains. On the west and south, the edges of the study area follow the drainage divides of the McCoy, Mule, and Palo Verde Mountains.

The base map for the study area was compiled at a scale of 1:62,500 from all or parts of the following U.S. Geological Survey topographic maps: Big Maria Mountains, Midland, McCoy Spring, and Palo Verde Mountains at a scale of 1:62,500; and McCoy Wash, Blythe Northeast, Ripley, Blythe, Palo Verde, Mule Wash, and Cibola at a scale of 1:24,000.

GEOLOGIC AND HYDROLOGIC FEATURES

Geologic Units and Their Water-Bearing Character

Geologic units in the Palo Verde Valley area are divided into two main groups, consolidated and unconsolidated rocks. Water-bearing characteristics of these two groups are dissimilar. The unconsolidated rocks are more porous and permeable than the consolidated rocks and contain most of the ground water stored in the area.

The consolidated rocks comprise the mountains and hills surrounding the valley areas and underlie the unconsolidated rocks that form the valley fill. Most of the precipitation in the drainage area falls on the mountains, but some falls directly upon the valley floor. Both surface-water runoff from the mountains and direct rainfall penetrate the valley alluvium to recharge the ground water in the unconsolidated rocks.

From oldest to youngest, the individual rock units are described in the following paragraphs:

Basement complex of pre-Tertiary age.--This includes igneous and metamorphic rocks composed of granite, diorite, quartzite, schist, gneiss, metalimestone, and metavolcanics. These rocks are non-water-bearing except where saturated along fractures and faults.

Volcanic rocks of Miocene(?) and Pliocene(?) age.--These rocks form an assemblage of intrusive and extrusive plugs, dikes, and flows. They are composed of andesite, rhyodacite, tuff, pyroclastic breccia, and agglomerate. These rocks include the Palo Verde volcanic sequence of Gamble and Donehy (1960) and yield little or no water to wells or springs.

Fanglomerate of Miocene(?) and Pliocene(?) age.--This unit is composed of well-indurated, reddish-brown volcanic debris. It includes the Tolbard Fanglomerate of Gamble and Donehy (1960). Water is not known to be produced from this unit within the study area. If the formation were penetrated by a well, it probably would not yield more than a few gallons of water per minute.

Continental and marine sedimentary rocks of Pliocene and Pleistocene age.--These rocks comprise moderately to highly indurated and well-bedded limestone, sandstone, tuffaceous siltstone, silt, sand, clay, tufa, and fanglomerate. Included are the Barren Mountain Group (composed of the Vinagre Formation, undifferentiated, and the Cibola Member of the Vinagre Formation from Gamble and Donehy, 1960) and the Bouse Formation, of Pliocene age, which are considered to be part marine and part continental in origin. The rocks, where saturated, will yield small to moderate quantities of water to wells, as described by Metzger, Loeltz, and Irelan (1973, p. 18-19). They indicated that the upper part of the Bouse Formation may yield 15 gallons of water per minute per foot of drawdown while the lower part of the Bouse Formation may yield as little as 1 (gal/min)/ft of drawdown. They also indicated that the thickness of the Bouse Formation in some areas may be as much as 900 ft.

Older alluvium of Pleistocene age.--This is composed of moderately indurated, well-sorted sand, gravel, boulders, silt, and clay. Where saturated, the older alluvium is the principal aquifer in the study area and will yield large quantities of water to wells. Wells may produce as much as 250 (gal/min)/ft of drawdown. Many wells produce water in the range between 1,000 and 2,500 gal/min. Included in the older alluvium is the Arroyo Seco Formation of Gamble and Donehy (1960).

Younger alluvium of Holocene age.--This is composed of unconsolidated sand, gravel, silt, and clay. It is dry in the mountains and on the slopes but contains water in the flood plain of the Colorado River where it yields water freely to wells.

Dune sand of Holocene age.--This is actively drifting sand that is generally dry. In places this sand may yield small quantities of water.

For a more detailed description of the geologic units and their water-bearing characteristics, see Metzger, Loeltz, and Irelan (1973).

Recharge and Discharge of Ground Water

Recharge to ground water in the Palo Verde Valley occurs as seepage from the Colorado River, ground-water inflow from Chuckwalla Valley (west of Blythe off base map), and direct infiltration of rain. Discharge from Palo Verde Valley is south to the Colorado River. Estimates of recharge and discharge were given by Metzger, Loeltz, and Irelan (1973).

Records of Water Level

Measurements of the water level have been made in many wells along the Colorado River flood plain on a weekly or monthly basis since 1922 by the Palo Verde Irrigation District. In many wells the fluctuation of the water table has been less than 5 ft for the period of record. Therefore, for those wells along the flood plain where the fluctuations are small, only two measurements a year are shown in table 3. If an unusual fluctuation occurred, it was included also.

Quality of Water

Ground water in Palo Verde Valley ranges in dissolved-solids concentration from about 500 to 13,000 milligrams per liter as shown by the chemical analyses in table 4. This indicates that the water varies from good to poor for public supply, irrigation, stock, and industrial uses. These analyses indicate that the major constituents in the water are sodium (Na), chloride (Cl), sulfate (SO_4), and bicarbonate (HCO_3). Table 5 lists the recommended limit for individual constituents in water used for public supply (U.S. Environmental Protection Agency, 1972). Many of the constituents listed in table 5 so rarely occur in objectionable concentrations that, unless requested, they are normally not determined in chemical analyses.

EXPLANATION OF WELL TABLE

[Boxhead explanations are abstracted and modified from U.S. Geological Survey "Instructions for Using the Punch-Card System for the Storage and Retrieval of Ground-Water Data"]

State number: The wells are identified according to their location in the rectangular system for the subdivision of public land. The identification consists of the township number, north or south; the range number, east or west; and the section number. The section is further subdivided into sixteen 40-acre tracts lettered consecutively (excepting I and O), beginning with A in the northeast corner of the section and progressing in a sinusoidal manner to R in the southeast corner. Wells within the 40-acre tract are numbered sequentially. The base line and meridian are indicated by the final letter, as follows: H, Humboldt; M, Mount Diablo; S, San Bernardino.

Owner or name: The apparent owner or user. In some cases, the local name of the well is given.

Inventory date: The year the well was field canvassed; other information given generally applies for this date.

Method drilled:

A	Rotary	P	Air percussion
B	Bored or augered	R	Reverse-rotary
C	Cable-tool	T	Trenching
D	Dug	V	Driven
N	Hydraulic-rotary	W	Drive-wash
J	Jetted	2	Other.

Depth of well: Depth, in feet below land-surface datum, is defined as the bottom of the perforated or screened interval or the bottom of the uncased part of the well.

Depth cased: Length of casing, in feet below land-surface datum, or to the top of the perforated or screened interval.

Well finish:

C	Porous concrete	O	Open end	W	Walled or shored
F	Gravel wall, perforated or slotted casing	P	Perforated or slotted casing	X	Open hole in aquifer (generally cased to aquifer)
G	Gravel wall, commercial screen	S	Screen		
H	Horizontal gallery or collector	T	Sand point	2	Other.

Diameter: Inside diameter of the well, in inches; nominal inside diameter, in inches, of the innermost casing at the surface for drilled cased wells.

Power:

1	Hand	3	Gasoline engine	4	Diesel engine	5	Electric motor	7	LP gas engine (propane or butane)
2	Natural gas engine	F	0-5 hp	M	0-50 hp	S	0-1 hp	A	0-20 hp
A	0-20 hp	G	>5-20	N	>50-150	T	>1-5	B	>20-50
B	>20-50	H	>20-50	P	>150-400	U	>5-15	C	>50-100
C	>50-100	J	>50-100	Q	>400-750	V	>15-100	D	>100-200
D	>100-200	K	>100-200	R	>750	W	>100	E	>200
E	>200	L	>200	6	Wind			8	Other.

Lift method:

A	Air
B	Bucket
C	Centrifugal
J	Jet
L	Multiple (centrifugal)
M	Multiple (turbine)
N	None
P	Piston
R	Rotary
S	Submergible
T	Turbine
Z	Other.

Water use:

A	Air conditioning	P	Public supply
B	Bottling	R	Recreation
C	Commercial	S	Stock supply
D	Dewatering	T	Institutional
E	Power generation	U	Unused
F	Fire protection	V	Repressurization
H	Domestic	W	Recharge
I	Irrigation	X	Desalination, public supply
M	Medicinal	Y	Desalination, other use
N	Industrial, including mining	Z	Other.

Well use:

A	Anode	X	Waste disposal
D	Drainage	Z	Destroyed.
G	Seismic hole		
H	Heat reservoir		
O	Observation		
P	Oil or gas		
R	Recharge		
T	Test hole		
U	Unused		
W	Withdraw water		

Altitude of lsd: Altitude of land-surface datum, in feet, above or below (-) mean sea level. Land-surface datum is an arbitrary plane closely approximating land surface at the time of the first measurement and used as the plane of reference for all subsequent measurements.

Number of water level: 0 Indicates one measurement; 1 indicates more than one measurement.

Chemical analyses:

- C Indicates one analysis in which the major chemical constituents were determined in order to permit an anion-cation equation balance
- M Indicates more than one analysis
- P Indicates one analysis in which a few selected constituents and properties were determined.

Pumping data:

- P Indicates pumping data available.

Log data: Restricted information. Availability to public dependent upon requester securing owner's permission.

A	Drilling-time	L	Laterolog
B	Casing-collar	M	Microlog
C	Caliper (diameter) survey	N	Neutron
D	Driller's	O	Microlaterolog
E	Electric	P	Photographic
F	Fluid-conductivity or fluid-resistivity	Q	Radioactive-tracer
G	Geologist or sample	R	Radiation (includes both neutron and gamma-ray)
H	Magnetic	S	Sonic
I	Induction	T	Temperature
J	Gamma-ray	U	Temperature and fluid-conductivity (resistivity)
K	Dipmeter or directional (inclinometer) survey	V	Fluid-velocity
		W	Electric and radiation
		X	Electric, radiation, caliper, and fluid-velocity
		Y	Electric, radiation, and sample (or driller's)
		Z	Electric, radiation, temperature, and fluid-conductivity
		8	Miscellaneous (other combinations).

TABLE 2.--*Description of spring 9S/20E-10DS1*

Local name	Clapp Spring
Date spring discharge was measured	August 30, 1972
Discharge	(1)
Water use	Unused
Chemical analysis	Partial
Altitude of land-surface datum,[2] in feet above mean sea level	600

[1]24-inch hole which has muddy water 10 inches below land surface.
[2]Land-surface datum is an arbitrary plane closely approximating land surface.

TABLE 3.--*Records of water level*

Letter(s) following water-level measurements:

A Well being pumped.
B Well pumped recently.
C Nearby well being pumped.
D Nearby well pumped recently.
E Estimated.
F Dry.
G Measurement by another agency.
H Tape measurement (recorder).
I Affected by atmospheric pressure.
J Water level below sea level.
K Measurement from recorder chart.
M Obstruction in well above water surface.
N No measurement.
O Discontinued.
P Destroyed.
Q Flowing.

4S/21E-9B1 S. DEPTH 1088 FT IN 1964.
LSD 860 FT ABOVE MSL.
HIGHEST WATER LEVEL 546.60 BELOW LSD, JULY 29, 1971,
LOWEST WATER LEVEL 546.60 BELOW LSD, JULY 29, 1971.
RECORDS AVAILABLE: 1971.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JULY 29, 1971	546.6						

4S/21E-15Z1 S. DEPTH 1202 FT IN 1964.
LSD 790 FT ABOVE MSL.
HIGHEST WATER LEVEL 466.00 BELOW LSD, MAY 26, 1964,
LOWEST WATER LEVEL 466.00 BELOW LSD, MAY 26, 1964.
RECORDS AVAILABLE: 1964.

TABLE 5.--*Public water supply criteria*

[Data from U.S. Environmental Protection Agency, 1972]

Constituent	Recommended limit (milligrams per liter except silver, which is in micrograms per liter)
Arsenic (As)	0.1
Ammonia (NH_4)	.5
Barium (Ba)	1.0
Cadmium (Cd)	.010
Chloride (Cl)	250
Chromium (Cr^{+6})	.05
Copper (Cu)	1.0
Fluoride (F)	[1]1.4-2.4
Iron (Fe)	.3
Lead (Pb)	.05
Manganese (Mn)	.05
Mercury (Hg)	.002
Nitrate-Nitrogen (N)	10
Nitrate (NO_3)	44
Selenium (Se)	.01
Silver (Ag)	1.0
Sulfate (SO_4)	250
Zinc (Zn)	5

[1]Depends on annual average of maximum daily air temperature.

TABLE 6.--*Pumping tests*

Time: Time of measurement, in minutes, after pump was started.

Static water level: Depth to water, in feet below or above (+) land-surface datum, prior to start of test.

Pumping water level: Depth to water, in feet below or above (+) land-surface datum, at end of test.

Drawdown: Difference, in feet, between the static and pumping water levels.

Yield: Yield of the well, in gallons per minute, for drawdown indicated.

Specific capacity: Yield, in gallons per minute per foot of drawdown. In a fully efficient and fully penetrating well, specific capacity directly reflects aquifer transmissivity. A declining specific capacity, with time, indicates deteriorating well condition. An increasing specific capacity indicates continuing development of the aquifer near the well. For a given amount of available drawdown, a well with a large specific capacity will have a greater yield than a well with a small specific capacity.

MAPS OF THE PALO VERDE VALLEY AREA, RIVERSIDE AND IMPERIAL COUNTIES, CALIFORNIA

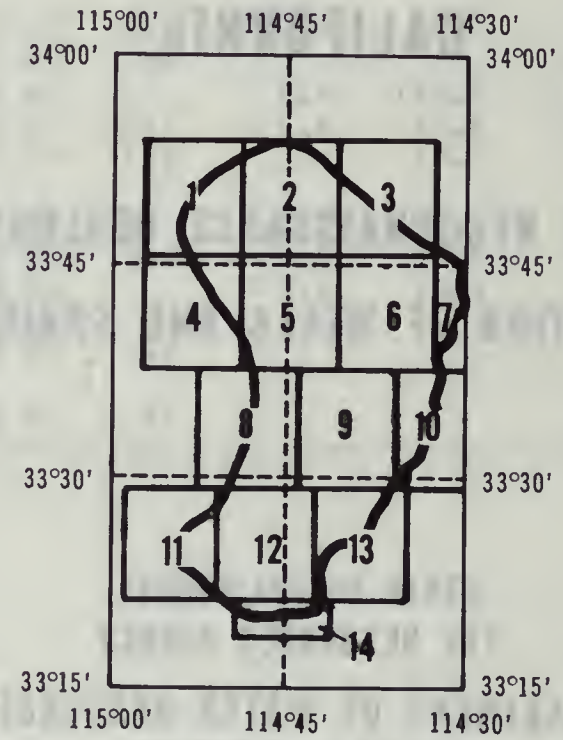

SHOWING RECONNAISSANCE GEOLOGY AND LOCATION OF WELLS AND SPRING

STATE OF CALIFORNIA
THE RESOURCES AGENCY
DEPARTMENT OF WATER RESOURCES
SOUTHERN DISTRICT

FEDERAL-STATE COOPERATIVE
GROUND-WATER INVESTIGATIONS
PREPARED BY U.S. GEOLOGICAL SURVEY

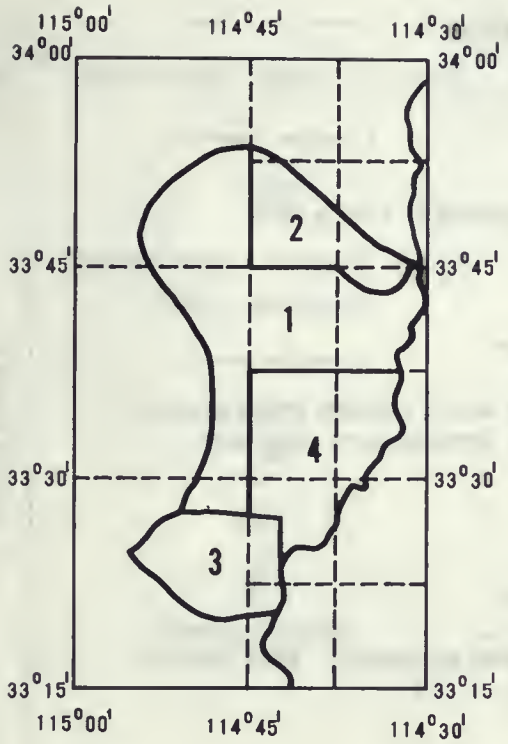

1977

This section consists of explanatory information and 14 page-size maps that show reconnaissance geology and location of wells and spring in the Palo Verde area. The area covered by each individual map is shown below. One composite map, about 33 by 42 inches, is available on request, at the requester's expense, from the district chief, U.S. Geological Survey, Water Resources Division, 855 Oak Grove Avenue, Menlo Park, California 94025.

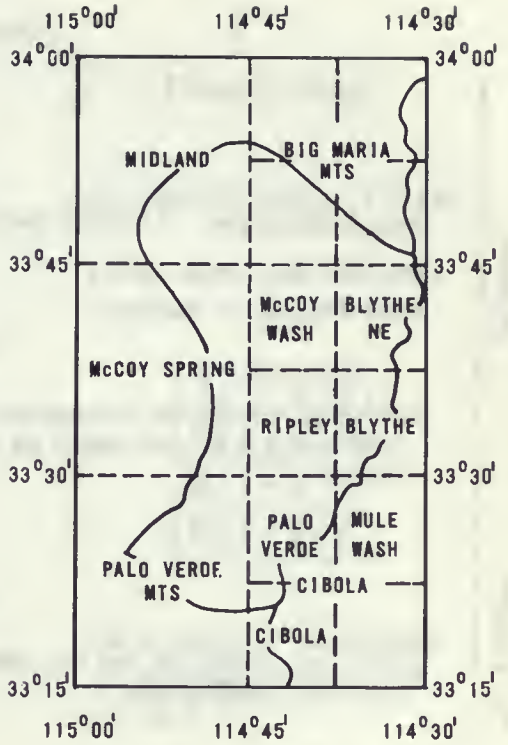

Location of wells and spring by W. R. Moyle, Jr., J. D. Horne, R. L. Blazs, and L. A. Price. Geology compiled by W. R. Moyle, Jr.

Base from U.S. Geological Survey
1:24,000 and 1:62,500 quadrangles

INDEX TO GEOLOGIC MAPPING

INDEX TO TOPOGRAPHIC MAPS

1 C. W. Jennings and R. B. Saul, unpublished, 1:62,500
2 Warren Hamilton, unpublished, 1:24,000
3 James Gamble and E. A. Donehy (Southern Pacific Land Co.), unpublished, 1:24,000
4 C. W. Jennings, unpublished, 1:62,500

All mapping published by the California Division of Mines and Geology on the Salton Sea Sheet (Jennings, 1967), scale 1:250,000. This map was compiled from the original field maps, scale 1:24,000 and 1:62,500

EXPLANATION

UNCONSOLIDATED ROCKS

Holocene

Qs

Dune sand

Actively drifting sand. If saturated would yield small quantities of water to wells

Qya

Younger alluvium

Sand, gravel, silt, and clay, unconsolidated. Above water table in mountains and on slopes. Contains water in the flood plain of the Colorado River. Where saturated, yields water freely to wells

Pleistocene

Qoa

Older alluvium

Gravel, sand, boulders, silt, and clay, moderately well sorted and indurated. Where saturated, yields water freely to wells

Pliocene and Pleistocene

QTc

Continental and marine sedimentary rocks

Limestone, sandstone, tuffaceous siltstone, silt, sand, clay, tufa, and fanglomerate, moderately to highly indurated. Yield small to moderate quantities of water to wells where saturated

Miocene(?) and Pliocene(?)

Tf

Fanglomerate

Fanglomerate, well-indurated, reddish-brown volcanic debris. Probably will yield little water to wells

CONSOLIDATED ROCKS

Miocene(?) and Pliocene(?)

Tv

Volcanic rocks

Intrusive and extrusive plugs, dikes, and flows composed of andesite, rhyodacite, tuff, pyroclastic breccia, and agglomerate. Yield little or no water to wells and springs

pTb

Basement complex

Igneous and metamorphic rocks composed of granite, diorite, quartzite, schist, gneiss, metalimestone, and metavolcanics. Impermeable except where highly fractured

QUATERNARY

TERTIARY

PRE-TERTIARY

MAP SYMBOLS

Approximate geologic contact

Fault

Dashed where inferred, dotted where concealed

Surface-water divide

A1

Well

C1

Destroyed well

DS1

Flowing spring

WELL-NUMBERING SYSTEM

Letter after well indicates position in section thus:

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

For a complete description of well-numbering system, see text
